

- Checklist**
- ✓ Integrate all endpoints
 - ✓ Handle responses
 - ✓ Handle errors
 - ✓ Include HTTP headers

ePayment API Integration Checklist

Partner name: NewCo AS

Merchant Serial Number (MSN): 545865 (test sales unit, NewCo AS)

Description of the solution: Vio Commerce (NewCo AS) is a shoppable-media platform: brands sell their products inside articles, video pages, Vev pages and apps; Vio runs cart, checkout and payment for many merchants, one Vipps sales unit each (own account, or one opened through the partnership). ePayment with WALLET / WEB_REDIRECT and profile sharing, Express with fixed or dynamic shipping, webhooks + polling + a 10-minute sweep into one idempotent order creation, receipts, capture / refund / cancel from the order page, the official Vipps MobilePay button component.

Endpoints to integrate <i>See the Quick Start guide for examples.</i>	Your Reference ID	Date of request
Example	654321000000000001	15/01-20xx
Create payment POST:/epayment/v1/payments	VIO-ac20bc9a-d938-4982-b11e-e43a862e1434	2026-10-08
Create payment with Express <i>Must be filled out if feature is used</i> POST:/epayment/v1/payments	VIO-3a985944-424e-479c-9d37-b0dbddf90d96	2026-10-08
Create payment with Profile sharing <i>Must be filled out if feature is used</i> POST:/epayment/v1/payments	VIO-ac20bc9a-d938-4982-b11e-e43a862e1434	2026-10-08
Create payment with Minimum user age <i>Must be filled out if feature is used</i> POST:/epayment/v1/payments	not used	-
Get payment GET:/epayment/v1/payments/{reference}	VIO-ac20bc9a-d938-4982-b11e-e43a862e1434	2026-10-08
Get payment event log GET:/epayment/v1/payments/{reference}/events	VIO-ac20bc9a-d938-4982-b11e-e43a862e1434	2026-10-08
Cancel payment POST:/epayment/v1/payments/{reference}/cancel	VIO-f20e9a47-09cc-4e20-bdb2-1d363b3eb2b8	2026-10-08
Full capture payment POST:/epayment/v1/payments/{reference}/capture	VIO-94c42c74-b3f1-4a2f-bd6d-519a1882cbdd	2026-10-08
Partial capture payment- POST:/epayment/v1/payments/{reference}/capture	VIO-ac20bc9a-d938-4982-b11e-e43a862e1434	2026-10-08
Full refund payment POST:/epayment/v1/payments/{reference}/refund	VIO-94c42c74-b3f1-4a2f-bd6d-519a1882cbdd	2026-10-08
Partial refund payment- POST:/epayment/v1/payments/{reference}/refund	VIO-ac20bc9a-d938-4982-b11e-e43a862e1434	2026-10-08

Quality assurance	Add your comments
Implement both webhooks and polling Use both webhooks and polling to ensure that the user gets the correct status as soon as possible. Set up polling as fallback in case of delayed webhooks. To minimize polling, you must also implement the Webhooks API to receive real-time updates on payment status changes. The merchant must also always poll GET:/epayment/v1/payments/{reference} to check the status of the payment. <i>Please describe your webhook and polling implementation</i>	All eight epayments.payment.*.v1 events are registered per sales unit (per partner in production); each delivery is signature-checked (HMAC-SHA256 over method, path, x-ms-date, host and body hash; current and previous secret) and handled once per event id; an unsigned one only triggers a re-read. Polling: on return our backend reads GET /epayment/v1/payments/{reference}; a sweep re-reads open payments older than 15 min every 10 min, for 7 days. All three paths share one idempotent handler under a database lock: the order is created once.
Handle payment states and events Make sure to handle all responses and states from the payment: CREATED, AUTHORIZED, ABORTED, EXPIRED, TERMINATED and the event CANCELLED, CAPTURED and REFUNDED.	☒ CREATED ☒ AUTHORIZED ☒ ABORTED ☒ EXPIRED ☒ TERMINATED ☒ CANCELLED ☒ CAPTURED ☒ REFUNDED
Handle errors Make sure to handle all errors. All integrations should display errors in a way that the users (customers and merchant employees/administrators) can see and understand them. <i>Please give examples on how your solution display errors to users</i>	Shopper: a plain message on the page, in Norwegian, when the payment is not AUTHORIZED on return (in English: the payment was cancelled or failed, please try again). Merchant: the reason on the order page, e.g. "Vipps: 12900 left to refund on this payment" or Vipps' own title and detail. Developer: VippsApiError with the HTTP status and Vipps' type, title, detail and traceId.
Proper logging All integrations should log error responses to be used for later reference in troubleshooting. Logs must include endpoint, headers, request body, error code and message. <i>Please supply an example from your logs</i>	[VippsConnector] POST /order-management/v2/ecom/receipts/ VIO-ac20bc9a-d938-4982-b11e-e43a862e1434 -> 409 Conflicting receipt - Receipt already exists (trace -). Logged for every failed call, followed by the error body and the request (headers with token and key masked, and body).
Include HTTP headers Send the HTTP headers in all API requests for better tracking and troubleshooting (mandatory for partners and platforms). <i>Please insert the value for the Vipps system headers</i>	Vipps-System-Name: Vio Vipps-System-Version: 4.0.1 (the shopcart release) Vipps-System-Plugin-Name: vio-commerce-shopcart Vipps-System-Plugin-Version: 4.0.1 Sent on every request; create, capture, refund and cancel also carry an Idempotency-Key.
Add information to the payment history We recommend adding order details to the payment. This is a great benefit for the end user experience. It is also mandatory for merchants using Content monitoring. <i>Please supply an example of order details if you utilize this.</i>	Sent after the authorization: POST /order-management/v2/ecom/receipts/{reference} with orderLines (name, id = the merchant's article number, totalAmount, totalAmountExcludingTax, totalTaxAmount, taxPercentage, productUrl), the delivery as its own line, and bottomLine {currency, receiptNumber = Vio order number}. Example: the Create payment reference.
Specify customer interaction For instore solutions it is required to specify the customer interaction by setting "customerInteraction: "CUSTOMER_PRESENT" on payment initiation. This is to determine that the customer is present at the time of purchase. <i>Please supply an example of a payment initiation request which includes this.</i>	Online only: every payment is created with customerInteraction CUSTOMER_NOT_PRESENT, userFlow WEB_REDIRECT, paymentMethod.type WALLET, profile.scope "name address email phoneNumber", reference, returnUrl, paymentDescription and metadata; Express adds shipping (fixedOptions or dynamicOptions) and allowedCountries.
Sign up for operational updates Subscribe to the Vipps MobilePay Operational Status Page for real-time updates on service availability, incidents, and maintenance.	☐ We have registered for the operational updates

Avoid integration pitfalls	Add your comments
Send a useful reference id Follow our reference recommendations. <i>Please explain the format of your reference id</i>	VIO-<checkout uuid> by default; a merchant may set a template: a prefix plus {checkout} or {short} (8 hex digits). Always ^[a-zA-Z0-9-]{8,64}\$, unique per sales unit; a new attempt on the same checkout gets -2, -3. The Vio order carries it; receipt and shop order carry the Vio order number.
Handle redirects The merchant must handle that the returnUrl URL is opened in the default browser on the phone, and not in a specific browser, in a specific tab, in an embedded browser, requiring a session token, etc. Follow our recommendations regarding handling redirects. <i>Please acknowledge that your system does not rely on session tokens etc.</i>	Acknowledged. The returnUrl is the page the shopper came from, with the checkout id as a query parameter (?vio_payment=success&vio_method=vipps&vio_sponsor=...&checkout_id=...). On return the page asks our backend, which reads GET /payments/{reference}: no cookie, session or token is needed, so any browser, tab or in-app browser completes the flow. If the shopper never comes back, the webhook or the sweep still creates the order.
Complete capture before expiration date For reserve capture payments, ensure to complete captures before the reservations expires. Once a reservation is expired it is no longer possible to capture. <i>Please explain your capture logic to ensure you capture before expiration</i>	At payment (Vio captures when the order is created), at shipment (tracking number or completion from the shop or Vio) or on account: the merchant presses Capture on the order page or captures in its portal; settings and guide warn that reservations expire. Never above the reservation.
Cancel authorized payments that will not be captured Authorized payments that will not be captured must be cancelled to ensure that the amount is not unnecessarily reserved on the users bank account. It is the merchant/partners responsibility to cancel the authorized payments using POST:/epayment/v1/payments/{reference}/cancel <i>Please explain your cancel logic to ensure no payments are left in reserved state</i>	An order cancelled in Vio or in the merchant's shop releases the reservation with POST /payments/{reference}/cancel, or refunds what was captured; a refund made in the shop does the same. A paid reservation whose order could not be created is released by the sweep after 24 hours and the failure logged. ABORTED, EXPIRED and TERMINATED close the checkout. Units under the partner always let Vio cancel; own accounts have it on by default.
Handle cross-border payments Vipps MobilePay is available to users across the Nordic countries and offers cross-border payments. Merchants must be able to handle customers from outside their country. <i>Please acknowledge that you are ready to handle cross-border payments</i>	Acknowledged. The shopper's name, address and phone come from Vipps (userDetails, shippingDetails) whatever the country. Express sets allowedCountries to the countries the merchant has shipping rates for (dynamic shipping) or to the checkout's country (fixed options); the amount is in the sales unit's currency (NOK). The merchant guide says so.
Follow the design guidelines The Vipps MobilePay branding must be according to the design guidelines. <i>Please acknowledge that you have read and used the design guidelines</i>	☒ We acknowledge that we have read and are using the design guidelines
Educate your customer support Make sure your customer support has all the tools and information they need available in your system, through the APIs listed in the first item in this checklist, and that they do not need to visit portal.vippsmobilepay.com for normal work. <i>Please explain how you educate your customer support to handle Vipps MobilePay transactions and which tools they have available</i>	Support works in Vio, not in the portal. The order page shows the payment as Vipps sees it (reserved, captured, refunded, released, state, reference) and offers Capture, Refund (full or partial) and Release reservation; an error from Vipps is shown as it came; Vipps' event log is available to support through our API. The reference (VIO-...) is on every order, so a case is found in both systems. The merchant guide's FAQ (attached) covers the usual questions.

Technical documentation	Add your comments
Provide technical documentation for merchants regarding: (Share a URL, plain text or PDF of the documentation)	
- How to apply for products	Attached as PDF: "Vipps MobilePay through Vio - merchant guide", section 1, How to apply: sign the Vipps agreement through Vio (we open the sales unit) or connect an existing Vipps account with its API keys, which Vio checks before saving.
- How to configure and use the solution	Same guide, sections 2-4: Settings -> Payments -> Vipps (Express, shipping options, capture mode, refunds and cancellations by Vio, reference format, webhook), what the shopper sees, and the order page with the Vipps payment card.
- Frequently Asked Questions (FAQs) for merchants	Same guide, section 5 (FAQ): when the money is taken, the delivery price in Express, a payment cancelled in the app, cancelling and refunding an order, countries, what to do when something fails.
Demo of your solution Showcase your solution, either with a link to a demo store, provide a video pr screenshots (PDF is preferred)	Test page (Aller Media's Mote & Livsstil, Vio web SDK, sales unit 545865): https://mote-livsstil-hub-vio.replit.app/skjonnhet/guider/vio-test-shoppable-favoritter Open a product and tap the Vipps buy button (Express) or pay with Vipps from the cart; use the Vipps test user.

Partners, please send your checklists to developer@vippsmobilepay.com. Include example reference IDs from the test environment and a description of the implemented solution.

We will verify the integration and contact you. After the checklist is approved, you'll receive all necessary information from partner@vippsmobilepay.com.
